The University of Asia Pacific

Ar. Ziaul Islam

Asst. Professor

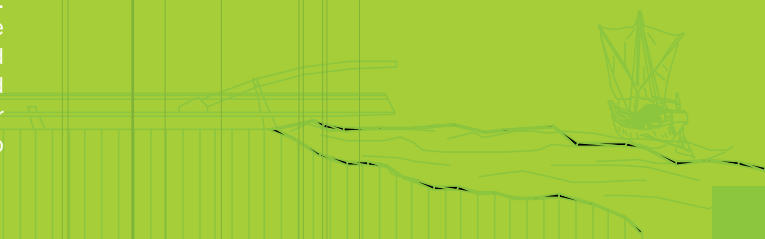

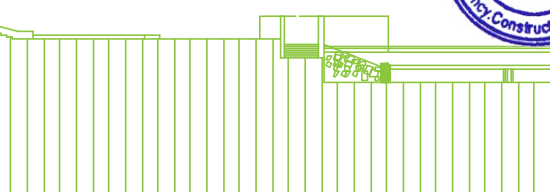

The University of Asia Pacific

ABSTRACT:

Bangladesh boats one of the largest feet of revering boats in the world . Boat building is an ancient skill, which has evolved into a craft of perfection, the knowledge of which has been transmitted through oral tradition. However, this perfected tradition is on the verge of extinction as all skill craftsmen are either changing their profession or their skill are less demand as the country experiences an increase of steel hull boat. The purpose of the museum will be to house various kinds of boats from various regions of Bangladesh and showcase the culture and the developed skill of boat making. In the entire world river valleys have always been played an integral role all where for civilization. They afford travel routes. Their alluvial soils bathed by waters generate agricultural soils for human beings which is originated from the Himalayan Region and fall into Bay of Bengal. Navigable rivers are important in commerce and have influenced the location of cities. The pride of Bangladesh is its rivers with one of the largest networks in the world with a total number of about 700 rivers which have a total length of about 24,140 km. Our ancient culture and inseparable heritage are focused on rivers. So we can't avoid our tradition, our life style, our transportation system nor our culture. So we should enrich ourselves with a keen knowledge of all the aspects of our social life influenced by river.

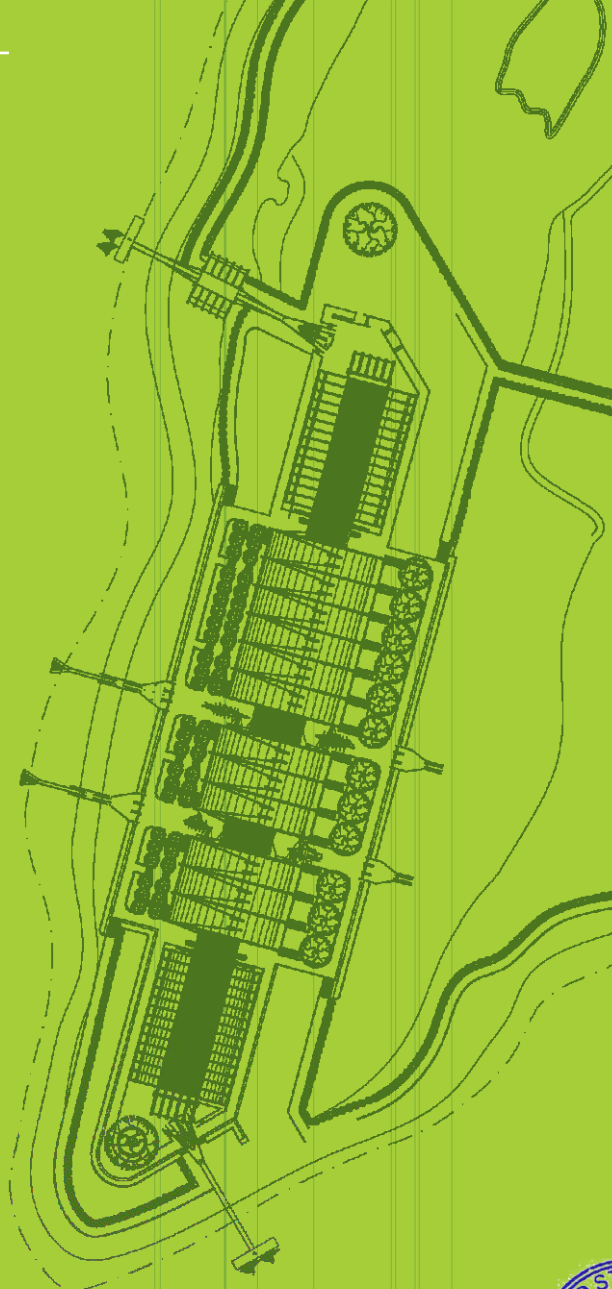

CONCEPT:

save the cultural heritage of our country which is on the verge of extinction provide the artisans (carpenters) with proper boat making facilities, concrete environment and acute treatments research on boat heritage and invent bridges between past and present cultures which will lead us to the better future enhance the chances for apprentices to gain proper knowledge to the monotonous life it will also fetch people to visit for refreshment and recreation it will affect positively in our tourism culture too.

SPACE & RESPONSES
Published at the year of 2006
September

ABSTRACT
This booklet was published as a catalogue of Architectural designs displayed in an exhibition titled 'SPACE & RESPONSES' held in the national museum in Dhaka in September 2006. The exhibition showcases twenty selected top-ranking Design-Studio projects done by final term students of Departments of Architecture of four universities-Bangladesh University of Science and Technology, Khulna University, Ahsanullah University of Science and Technology And The university of Asia Pacific.

Aspiring Architect

REVIVING SADAR GHAT

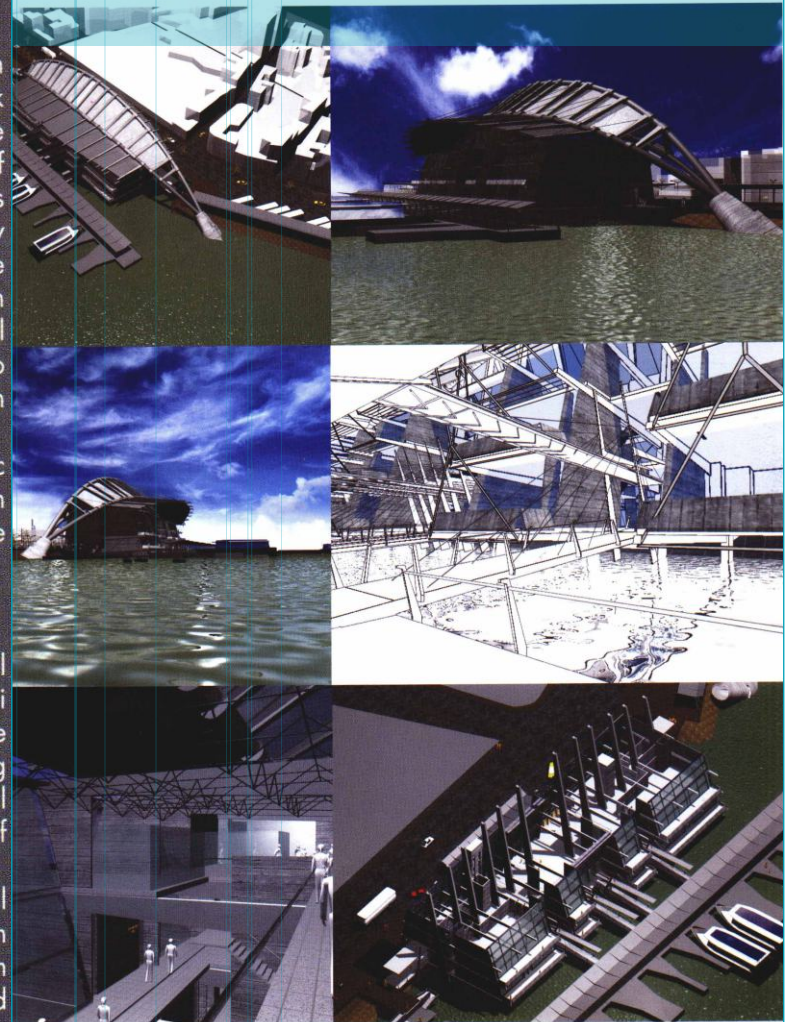

Buriganga, the river that sparked the beginning of the city of Dhaka in Bangladesh, today, sadly, has turned into nothing more than a 'back alley'. Only a part of the water transportation system operates through the river and widespread encroachments and pollution have made it more of a liability than an asset. Furthermore, the urban fabric and arrangements of spaces around the riverside are not enriched by it or even properly connected to it. Recent years have witnessed a sense of urgency about the appropriate reintegration of the river into the city developing within an informed section of the citizens of Dhaka, as well as some architectural academics (although the overall vision and action plan to this end is yet to be defined). Unfortunately, the way, in which the issue is viewed, can sometimes be described as rather unrealistically romantic and apolitical.

The students design studio is utilised to make enquiries in specific directions that help to establish a vital knowledge base, one that would in turn lead to a better integration of the importance of the river and the actual mechanisms of the city.

THE CONCEPT

This particular project proposes a complex form of a multi-modal terminal that includes firstly the inter-city launch terminal, secondly the water taxi terminal (connecting various peripheral points of Dhaka city, while allowing a successful shift of traffic from the narrow roads running along the river edge to the new waterscape), and thirdly, the local bus terminal (acting as a communication interface between these two different levels of mass transportation).

Moreover, as students are expected to look beyond the individual project and its location, to learn about correctly placing a project in an urban context, this exercise tries to push the boundary of the built form further and connect the complex matrix of human society, urbanity and environment.
